

It Is Our Responsibility to Protect Our Planet Earth!

by Benjamin Huang
Diamond Bar High School, CA

There are currently many human beings living on the Earth today. Sadly, the majority of the population thinks that the Earth contains an unlimited supply of necessities; however, this is not the current case of our world today. With multiple weather problems, depleting resources, and widespread pollution, the whole population of the Earth must unite as one and help alleviate the many problems that may become detrimental to the Earth in the future.

I think that saving energy is a very small, but crucial step into saving the Earth. by saving energy like electricity, one would not only save money, but also help lower the use of nuclear power that may prove to be harmful soon. People should not only save electricity, but also save on other resources such as water, wood, and fossil fuels. In many areas around the world, drinking water is becoming scarce of misuse or lack of nearby water sources. Water is the main liquid that humans and other species drink in order to survive. Once all sources of drinking water are gone, the world will lose not only the human population, but also the animal population as well. The Earth will be destroyed by our hands; however, there is hope for saving our planet. By conserving resources and using reusable bags and bottles, the world may become a better place to live in, one step at a time.
