Zamboanga City, Philippines

As we can notice the earth now is not anymore clean, the environment is very polluted, we always suffer from different typhoons, our climate also is not anymore normal. Maybe one of the reasons is the growth of population, as we observed people now are not well trained because of their bad actions like throwing their garbage anywhere, it is one of the reasons why we are suffering from flashfloods. Philippines is one of the countries who is suffering from this kind of calamity. Dynamite fishing can also occur that lessen the fish in the sea. Fishermen using this way of fishing are destroying the coral reefs in the sea and they also destroy the plants in the sea. Cutting of trees like illegal logging, this kind of work may also cause landslide. If our country now is not good it's because we are abusing the nature. If we wish to save the earth we must maintain our environment clean, we must throw our garbage in the proper place. We must take good care of the earth to avoid all the possible calamities.
