Our planet is in a great danger. Reports and newscasts tell us the wildlife and forests are disappearing at an alarming rate. Several plans have been developed to stop the abuse of the Earth but some of them didn't work. Is there a chance for us to live in a clean and green environment?

Yes, in fact, we don't have to feel helpless because there are many simple and practical ways to save our environment.

As student, we have a very big role in saving the Earth and I will discuss in this article some of the roles which can be executed by anyone.

First is by preserving our environment. We need to take good care of our natural resources and the simple way of doing this is not to let food on our plate go to waste. Since our supply of food is limited, we have to conserve our food and conserve it properly and proportionally.

Another is by patronizing our recyclable products like bringing old newspapers and bottles to junk shops. We must be aware also of the enviro-criminals that destroy our natural resources like dynamite fishing and illegal logging to quit their lines of work by reporting them to the authorities.

We have also the solar panels which are series of mirrors that transform sunlight into solar energy.

As concerned citizens, we must strive to learn more about negative effects of abusive and wasteful use of our natural resources by making ourselves receptive and attentive to the educational programs of the government. We must work hand in hand with the different agencies to enforce environment programs. We must elect leaders who are reputed to be advocates of environment conservation so that we can be sure that relevant projects and laws will be enforced. By this means do our responsibility to save our Earth.
