“Safe guarding the earth with genuine heart and good words”

Why do we have to save the earth? Our planet earth contains an astonishing variety of landscapes and climates. Since life began around 4,000 million years ago, it has gone through extraordinary changes in its climates and in the species that live on it. But not it seems that our planet is being transformed not by natural events, but by the actions of one species, mankind.

We need to save the earth because it is our only home where we live. Earth is the only planet that has plenty of oxygen. If the earth is destroy we will all die.

Let's us join our part to save the environment for the better future.
