In my own opinion the way on how to protect our environment system is that to minimize cutting of trees in our forest, also control throwing waste in our river. Because it will cause for the pollution. As they put on plastic gloves for their first. Letter hunt, the third grade know what to expect. They knew their garbage. It was part of their science curriculum at bridges. They learned the three reduce, inside the world of trash. For home work, they had kept garbage diaries and drawn color-code charts of their families trash, so they were primed for the field experiments on this way. We have to help the earth. The equipment also seemed to be a greater burden on the environment, because the bags and globs would occupy more space in a landfill than two bottle.

After consideration, I would have though deeper before making a decision. Damaging the environment is not a petty issue. Once it is damage beyond repair, it might wipeout our species. In the effort of protecting the environment, we will consider the effect of our actions before making decision. The needs to recycle are base on the fact that our natural resources are diminishing. If we do not recycle, factories will have to process the raw material an this will result in more heat release into the environment. A very basic way to recycle is to separate our rubbish into paper, metal and glass. Other. Other waste such as food can be use to make compose.
