We have to save the earth because it is now in danger. Many countries in Asia are experiencing climate change or global warming. Actually not only in Asia, it's happening in every part of the world, especially in North Pole where the ozone depletion is happening, wherein the ice are melting. If we can't overcome this the water level will rise and many countries will be drowned in flood, like what is happening in China today. Natural calamities killed more than a thousand people this year and caused tens of billions of dollars in damage across 28 provinces and regions. And so did the flooding in Pakistan wherein approximately 1500 people were killed.

It's only because some people don't think about the earth, they don't love the earth, instead of planting trees, and they intend to cut it over and over again for the reason of money. And they don't replace the cut trees.

If we are going to observe between cities and rural areas, there are lesser trees in cities, there are more buildings, compared to rural areas. In science we learn that trees absorb water, so we see the importance of trees. We are destroying our world, our earth, our home. We need to think that green symbolizes trees, and trees symbolize hope. In every tree there's hope for us to start.

Saving the earth requires a collective effort of all mankind, and a good place to start is to grow vegetables at home, buy local products, and keep recycling plastic, glass, papers and aluminum. You can also save the earth by reducing the amount of energy you use, reusing items instead of throwing them away, and recycling items that can be turned into something else.
