All of the external organisms may affect the nature. These factors maybe living organisms or non-living variables, such as temperatures, rainfall, day length, wind and ocean currents. The interactions of organism with biotic and a biotic factors form an ecosystem. Even minute changes in any one factor in an ecosystem can influence whether or not a particular plant or animal species will be successful in its environment. Like all other living creatures, humans have clearly changed their environment, but they have grander scale than have all other species. Some of these human-induced changes such as the destruction of the world's tropical rain forest. In turn; altered climate pattern have change the way animals and plants are distributed in different ecosystem. The problems facing the environment are vast and diverse. Global warming, the depletion of the ozone layer in the atmosphere.

Human population growth is at the root of virtually all of the world's environmental problems. As the number of people increases, crowding generates pollution, destroy more habitats, and uses up additional natural resources.

A significant portion of industry and transportation burns fossil fuels, such as gasoline. When these fuels burn, chemicals and particulate matter are released into the atmosphere. These numbers of substances contribute to air pollution. In my opinion, these all factors threatening the environment can stop. We can prevent it because we are the people who live here in earth. We can the environment by doing good way. There are so many ways to save our environment. One reasonable solution combines conservation strategies with the increased use of solar energy. It can help us to generate our electricity. We can stop polluting our air.

Global environmental collapsed is not inevitable but the developed world must work with the developing world to ensure that new industrialized economies do not add to the world environmental problems. Politicians must think of sustainable development rather than economic expansion. Conservation strategies have to become more widely accepted, and people must learn that energy use can be dramatically diminished without sacrificing comfort. In short, with the technology that currently exists, the years of global environmental mistreatment can begin to be reversed.
