Mother Earth/ Environment our God's Creation. It is beautiful to live on for people like us. However, as we all observe or notices, these God's Creation are getting worst year by year.

First of all, Air Pollution, addition of harmful substances to the atmosphere resulting in damage to the environment, human health and quality of life. Air Pollution occurs in homes, schools, offices, in cities, across continents even globally. It makes people sick that causes breathing problems. It harms plants, animals and the ecosystems in which they live. Some air pollutants return to the earth in the form of acid rain and snow, which corrode statues and buildings, damage crops and forest, make lakes and streams unsuitable for fish and other plants and animals life.

Pollution is changing Earth's atmosphere so that it lets in more harmful radiation from the sun. At the same time, our polluted atmosphere is becoming better insulator, preventing heat from escaping back into space and leading to a rise in global average temperatures, referred to as a Global Warming. It will affect world's food supply, alter sea level, make weather more extreme, and increases the spread of tropical diseases.

There are other things that causes Global Warming like the rapid expansion of agricultural and industrial activities over the last hundred years which have generated significant increases in carbon dioxide and methane in the atmosphere like the burning of fossil fuels have led to buildup of heat-trapping greenhouse gases in the atmosphere.

On the other hand, some countries try and agree global emission reduction but it also hurt developing countries because such reduction interferes their plans for economic development through inexpensive, carbon-based energy sources. Indeed, many representatives of developing countries see Global Warming advocates as part of a conspiracy to maintain the economic advantages of industrialized nations at the expense of poorer nations. Thus, developing countries argued that they be exempted from emission reductions until their economies approached the strength of those in developed nations.

Local government also working against greenhouse emissions by conserving energy in buildings, modernizing their vehicles and advising the public, individuals too can take steps. The same choices that reduce other kinds of pollution work against Global Warming. Every time a consumer buys an energy-efficient appliances, adds insulation to a house, work or commute by public transportation, He or She is fighting GLOBAL WARMING.
