Saving the earth? There are many ways to save the earth, like for example avoid cutting off trees, burning plastics, improper disposal of waste materials, smoke belching.

As we observe some places here in the Philippines always get flood. It is because of illegal loggers, cutting off trees and some residence throwing their waste improperly.

Garbage waste materials, burning of woods and plastics and smoke of some vehicles will result to environmental pollutions. We need to minimize these pollutants because the ozone layer of the earth is being jeopardized. Avoid using disposable items as much as possible. Anything we use only few times and throw away consumes resources only to spend centuries in a landfill.

Another is avoid using plastic whenever we can because it is a poison of the earth like disposable cups, plastic bags, nonsense plastic items we don't need. It never breaks down and has led to the poisoning and death of numerous rivers. Plastic can be recycled in our area, some cities have programs for recycling plastic bags and other difficult to recycle types of plastic use resealable, reusable containers instead of plastic wrap or bag.
