

## **HOW TO SAVE THE EARTH**

Frances Jean F. Madaje  
BS Radiologic Technology  
Universidad de Zamboanga  
Zamboanga City, Philippines

Saving the earth is very important because it was the most beautiful thing that created by God. I propose a way to stimulate the earth' capacity to sure itself, as an emergency treatment for the pathology of global warming. Measurement of the climate system show that the earth is fast becoming hotter planet than anything get experienced by humans. Processes that would normally regulate climate are being driven to amplify warming. Such feedbacks, as well as the inertia of the earth system and that of our response make it doubtful that any of the well intentioned technical or social schemes for carbon dieting. The ocean, which cover more than 70% of the earth's surface are a promising place to seek a regulating influence. One approach would be to use free-floating or tethered vertical pipes to increase the mixing of nutrient rich water below to the thermo cline with the relatively barren waters at the ocean surface 30% of the earth is composed of land.

There are simple ways we can do to save the earth like, turn off the lights, unplug appliances when not in use, separate our garbage, use less water, drive slower, go solar, mount a windmill on our roof, work at a time, know the law, plant trees, through these simple ways it can help to minimize the heat of the earth. People are created by God to care the earth but sad to say that the people also who are the one destroying it. Through the smoke of big factories and not proper throwing of garbages. People can make a way to help the climate change through uniqueness of mind and think what are the things can help to secure the earth, so that the new generation can still see the beautiful surface of god's creation and they will also follow us to care the earth.
