

HOW TO SAVE THE EARTH

Mary Wapole F. Adrial
BS Respiratory Therapy
Universidad de Zamboanga
Zamboanga City, Philippines

It is now the right time to do our own share in protecting earth and her own wonderful creatures. The earth is actually not dying, it has been very much alive and well since long before human existed, and if we, in our Polly, manage to wipe ourselves out, the earth will continue to be very much alive and well, long after we are gone. Our planet is indeed gasping for breath now, our harmful pollutions is indeed choking her slowly and continues to strip her with her ozone layer. It is about time to give our timely response to this alarming state of the only planet we live in. We will be harming ourselves in our own way in the future for nature has its own destructive way of getting back to us humans; the signs of earth's displeasure with inappropriate and harmful activities of humans are now seen and felt all across the globe like global warming, climate change, acid rain, drought, and other forms of natural disasters.

The biggest challenge that mankind is facing in this century is the global warming and there is a global warming given by the scientists. Every individual can join hands in this global mission on how to save the earth from global warming.

We can teach children or of the society on how to love and appreciate the importance the safeguarding to the world. It is true improvements in unavoidable but we can avoid destroying the earth for it is not our permanent property for us to enjoy on our own as we wish. We are only sharing and it should be handed over to the following generation with the same how we got it from our predecessor. Only after the last tree has cut down, the last river has been poisoned, the last fish caught, only then we will find that money cannot be eaten.

People must learn how to reduce, reuse and recycle. Make it a habit to reduce the things we need or we consume. Purchase only the things that we need and eat only what you can. Let us do our share not to be part of the problem or should I say part of the garbage problem. Reuse all the things that can still be repaired/fixed or those things that are still okay. Recycle things to conserve our resources, collect old newspapers, books, magazines and uses papers, bottles (glass & plastic) and any other things that you could sell in junk yards. There is money in garbage and at the same time were doing our part in recycling process. We must also conserve energy. Be kind to trees. As much as possible, use forest products and timber very well with optimum efficiency. You may use the back of coupons, use pencils until it becomes small as possible, and don't play with matches. Try to get involve in tree planting in your local conservation program.

This could be fun, as trees can give us added oxygen, shades for people and a refuge to different insects and birds.

Do not buy exotic and endangered animals. These animals are intended to be in the wild not as mere decorations to your name or pets. Support any environmental conservation in your community; you may give some donations if this will not bother you to support their cause. You may also join them in their information dissemination drive and campaign as well.

Little things and ways on how to save the earth isn't hard at all, if we will only start this to ourselves and unite to the other communities. If unity will occur there will be peace and we can assure that God will help us in His very own way.
