

LOVE THE EARTH

Nicole C. Estenote
BS Medical Technology
Universidad de Zamboanga
Zamboanga City, Philippines

Right now Mother Earth is absolutely gasping for air. The pollution we caused is destroying the ozone layer. We are the ones who are destroying the protection given by mother earth from the harmful rays of ultraviolet.

We are so blessed to be on earth and that mother earth provided us a protection without even asking for it. Maybe she is just thankful that of all the planets on the solar system we were all created on earth. But instead of helping her, we are the ones who are destroying the protection she gave, the protections which we can conclude that is love.

If you go back thousands of years, you can see the real love shown by the people to the earth, there were no technologies and machines that harm mother earth, but of course, as time goes by, people change, population increased, and so does knowledge. That's why technologies and machines were created to satisfy the needs and wants of people, which are some harmful to mother earth and plus the wrong doings of people. If the UV rays are already a threat to us, what more if nature will defend itself against us?

Mother Earth's noticeable displeasure with all the wrong doings and harmful activities are now shown and felt across the globe. Climate change, global warming, acid rain, flash floods and other natural calamities. This can be prevented, but how can we forestall all of this if we keep on doing all those harmful activities?

Saving mother earth is still possible; it is never too late to love the earth with all our hearts. It is never too late to change, renew, maintain the cleanliness and the well-being of the earth. We can still save mother earth from destruction and we can still care mother earth when it is already badly damaged because in that way, we can show mother earth that we love her.
