

HOW TO SAVE THE ENVIRONMENT?

BSN Student: Amirah F. Jumahali
School of Allied Medicine
Universidad de Zamboanga
Zamboanga City, Philippines

As we human beings we are so blessed to live in a world which is beautiful with so many picturesque views of trees, mountains, flowers, seas and animals. We must protect and maintain them in their natural state. To save our environment we must first to do is to reduce waste materials in our house, work place, schools and even in shopping malls or plaza so that there is no spreading of diseases carried by the flies and other garbage animals, by choosing the quality of reusable products instead of disposable. We must also recycle the things that can be recycled such as papers, plastics, glass and aluminum cans, to reduce the number of garbage disposal in our everyday living. These are also the materials that cannot be burned so that it won't contribute to air pollution.

To save the environment in our house as we use appliances we must turn all the appliances off or better yet unplug them when not in use so that we won't consume much in electricity and we can help in preventing or reduce global warming.

To save the environment the first thing we must not do is to cut trees, instead we plant a tree because trees help a lot to us to breathe fresh air. Trees also help during rainy season because it will help or protect us from landslide. As a whole we must take good care of our environment because our health and life depends on the environment we live.
