HOW TO SAVE THE ENVIRONMENT

Our environment is very important, without environment we don't have any place to live in order to save our environment we should not throw our garbage any where especially in the bodies of water, where the habitat of fish that we eat. Here in the Philippines it is important to save our environment because we are rich of natural resources. We should take care of it by cleaning and conserve it. We should not pollute the air so that we can breathe fresh air and help save our environment.

For me as a student I can help save the environment by not throwing garbage anywhere. Teaching some people to clean their surroundings, especially the people who live near the seas and rivers. I can also health teach them by it to prevent diseases and illness. If we live in a clean environment we can prevent diseases at the same time we can help save our environment. Saving environment is also saving lives
