

MOTHER EARTH SAVE FROM GLOBAL WARMING

Student: Khadiya A. Mutalib
School of Allied Medicine
Universidad de Zamboanga
Zamboanga City, Philippines

In this century we are facing the global warming one is the pollution, if this is going to continue we may lose our land to ocean and the different climate conditions may also lead to new unknown diseases which may challenge the medical world. Now itself we have started to feel the impact of this global warming. Before the time is late we have to save our earth just like, instead of everyone using their own vehicle some of you are working in the same area and living in the same area you can share one vehicle. Start to recycle the things that you think it can be used again and it can be our needed.

Our planet earth is indeed gasping for breath right now, our harmful pollutions are indeed choking her slowly and continues to strip her ozone layer. So we have to save this tragedy just like climate change, acid rain, flashfloods, and other forms of natural catastrophes plus another thing that can cause global warming are the illegal loggers they destroy our mother by cutting trees that can cause flashfloods or landslides. Instead of destroying our trees we need to plant more trees to help our mother earth in pollution.

Another thing are the factories which can cause a global warming by its smoke that can destroy the earth and it can cause pollution. Another one is the over population, we need to have a family planning to prevent over population.
