Universidad de Zamboanga
Zamboanga City, Philippines

There are so many ways in saving our environment. Love and respect for our environment is what we need. Separating organic wastes from inorganic wastes is one way of saving our environment. Organic wastes is very useful because we can use that as a fertilizer.

Let us all be united in cleaning our environment because that is the way to save our environment. Many are dying today because of dirty environment. Helping the environment means living animals are included as well. All endangered species should be taken care of instead of being destroyed.

Another way of saving the earth is by reusing and recycling biodegradable waste materials. Through this we can make the environment healthy.
