Zamboanga City, Philippines

The environment is where we get use of all our resources. Almost everything we use in our daily living is from the environment, the trees from building our houses and plants for our food and our business. That is how important the environment is.

As time passes, the population of different countries increase and this means that our need for the resources also increases. We will be needing spaces for people to live. It also adds to the pollution to increase.

We have always been working on how to save our environment. There is some project or programs like planting of trees and cleaning the surrounding and rivers. But for me, cleaning the river will be lesser if people will not pollute them by throwing their garbage and waste. Some people recycle their waste so that it can be used again.

Saving our environment begin within ourselves. We should be responsible and disciplined. This is not only for our environment but also for us.
