Zamboanga City, Philippines

Of all the planets in our solar system that is made by our Almighty God, life exists only on the earth. There are more than 2 million different species of plants and animals that is present in our planet, the Earth. All of these exist in a thin layer around outside of the Earth. This layer, which we call environment or surroundings, includes all the living things that share our planet.

Water, food, air and many more are needed by all living things especially; we humans barely need it in order for us to survive. We can get food from our crops; as we all know over 1.4 billion cu km (336 million cu mi) of water exists on Earth, and air for breathing.

But we humans are abusing and destroying some of the beauties in our environment. Illegal loggers cut and burn those tall trees, some of us throw our garbage's in some bodies of water, factories releasing toxic chemicals through the bodies of water, and polluted air that is release by factories and vehicles. All of this is bad to our health but we people are very uncontrollable so that is why we have floods, soil erosion, global warming and many more environmental problems.

If we continue this uncontrollable using of Earth's raw materials at today's fast rate, our resources will soon run out. Instead of throwing raw materials we should try recycling it, at least we can help. For the illegal loggers if you really need to cut trees you should plant a replacement tree for it so that the next generation can see the beautiful environment that is given to us by our Almighty God.

We should remember that what we see in our environment is not infinite but finite, so we should learn to protect and conserve our environment. Our future is not really bad and good. We have great minds that we can use to save our environment.
