Zamboanga City, Philippines

I do not believe that there isn't an environmental, population or resources crisis in all aspects. I think that there is. And I don't believe that the situation is becoming better. But there are problem facing the world today that we must deal with. Such as the our population situation facing many third world countries., I think that the endangered species is the least of our problems out of the degradation of the environment, our population and the vanishing biodiversity. Although the animals are important to many aspects of life as well as many different cultures, it isn't the most vital statistics that we must work on. An environmental is a complex of external factors that acts on a system determined its course and form of existence. An environment may be thought of a superset, of which the given system is a subset. An environment may have one or more parameters, physical or otherwise. The environment of a given system must necessarily interact with that system.
